PROJECT SUMMARY

Project Name:	Avondale Woods Sections 2 & 3
Location:	City of Dublin, Franklin County, Ohio
Type:	Stormwater Management Plan
Reviewing Agency:	City of Dublin, Ohio EPA

HYDROLOGIC SUMMARY

Rainfall Data: City of Dublin Stormwater Management Design Manual

1-yr	2.20”
2-yr	2.63”
5-yr	3.24”
10-yr	3.74”
25-yr	4.44”
50-yr	5.02”
100-yr	5.63”

Rainfall Distribution:	NRCS Type II 24 hour
Detention Policy:	City of Dublin
Water Quality:	City of Dublin, Ohio EPA
Hydrology Modeling Program:	HydroCAD 10.10

DESIGN SUMMARY

Detention:	Dry Basin and Wet Basin
Water Quality:	Wet Basin
Receiving Water Body:	48” storm sewer (per the Stormwater Master Plan for Avery/Hayden Run/Cosgray Road Development) which discharges to an existing detention system before flowing into Hayden Run near I-270

REVISIONS

November 2022 Submittal: Addressed City comments including, but not limited to: Adding reference and more narrative about Sections 1 of this stormwater report, adding the tributary linework for Hayden Run Boulevard to the tributary maps, adding Exhibit 3 showing the overlay of the “Hydrologic Report For Sewer Line Extension and Preliminary Master Plan For Stormwater Detention – Avery/Hayden Run/Cosgray Road Development” master planning area, added elevation-area-storage tables for the basins.

TABLE OF CONTENTS

TABLES

APPENDICES

1.0 INTRODUCTION

The following report provides a detailed analysis and design of the Stormwater Management Plan for Avondale Woods Sections 2 & 3. The original Avondale Woods Phase 1 and 2 report was approved in October 2010. The initial basin grading and construction occurred with this plan and report approval. The Avondale Woods Section 1 plan and report were revised in April of 2017 to expand the basin contours on Wet Basin 01 to account for the final full build impervious area instead of just the sediment basin phase. This report revises the Section 1 report with final impervious and storm sewer layouts for the Avondale Woods Sections 2 & 3.

The proposed site is located north of Hayden Run Boulevard, west of Avery Road, and east of the existing railroad tracks. The proposed project area involves the development of agricultural land into a mixed residential development. The runoff from this site will be routed through a dry basin for quantity control and a wet basin for water quality and quantity control before discharging into an existing 48" storm sewer (per the allowable release rates set by the Stormwater Master Plan for Avery/Hayden Run/Cosgray Road Development dated January, 2004) which discharges to an existing detention facility and eventually discharges into Hayden Run near I-270.

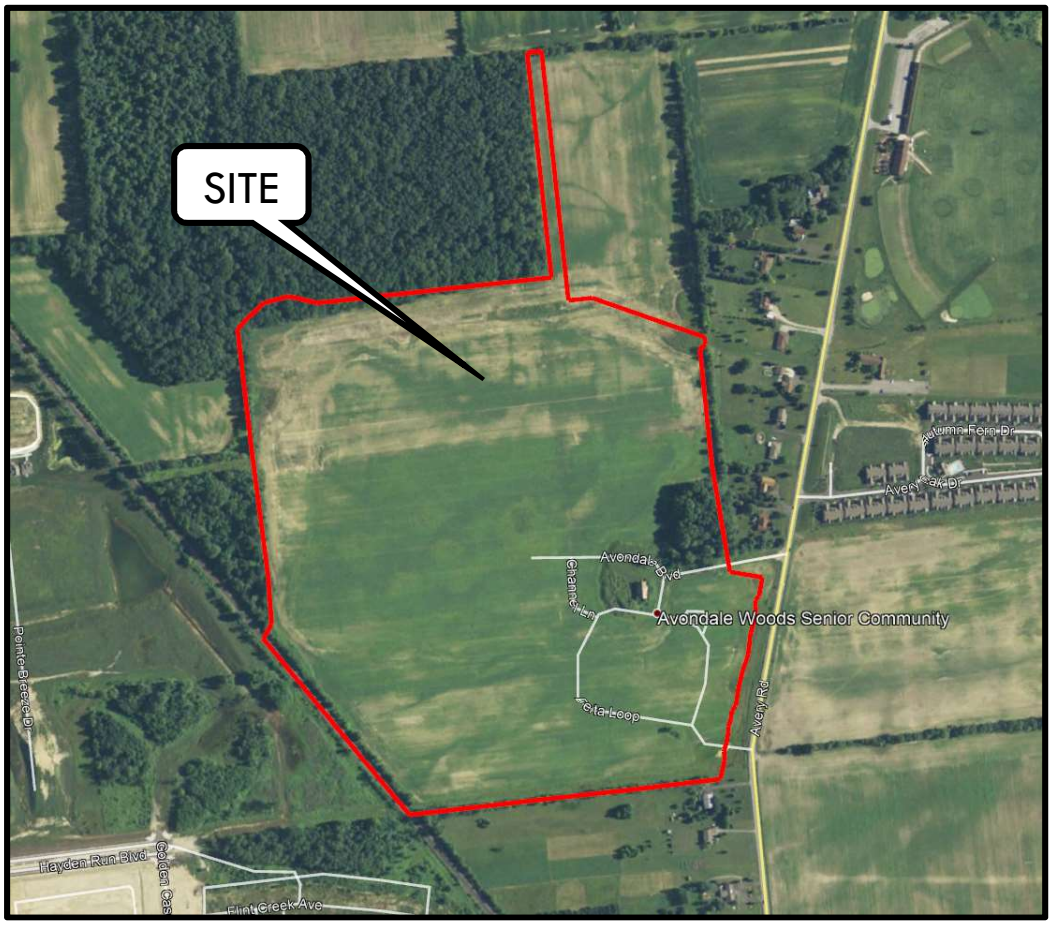

Figure 1 – Site Location Map

2.0 HYDROLOGIC ANALYSIS

Hydrologic parameters such as Runoff Curve Number (RCN) and Time of Concentration were determined using standard Natural Resources Conservation Service (NRCS) methodology. The 1-, 2-, 5-, 10-, 25-, 50-, and 100-year storm event discharge amounts were calculated using the NRCS TR-55 method. This analysis reflects the NRCS Type II distribution, 24-hr storm duration. Rainfall depths were obtained from NOAA Atlas 14, Volume 2, Version 3, 2004. The peak flow rates were computed using the HydroCAD 10.10 computer program.

3.0 PRE-DEVELOPED ANALYSIS

The pre-developed condition, as seen on Exhibit 1 in Appendix E, consists of agricultural land in good condition in Type "C" soils (Crosby silt loam, Kokomo silty clay loam, and Lewisburg-Crosby complex) which corresponds to a Runoff Curve Number of 78. The pre-developed subareas are located within subareas 120, 150, and 920 of the Brown/Horch Creek (120, 150) and Hirth/Wolpert Creek (920) Watersheds per the City of Dublin's Stormwater Master Plan. Pre-developed 01 naturally drains to the east toward Avery Road within the Brown/Horch Creek watersheds. Pre-developed 02 naturally drains to the northeast toward Avery Road in the Hirth/Wolpert Creek Watershed. The Brown/Horch Creek watershed is the ultimate outfall for the site. Therefore, Pre-developed 02 and any drainage in the Hirth/Wolpert Creek Watershed will be considered diversions.

All pre-developed subarea characteristics are summarized in Table 1. Pre-developed peak flow rates are provided in Table 2. Pre-developed 02 will be a diversion in the proposed condition, but pre-developed peak flow rates have still been provided in Table 2. All time of concentration calculations can be found in the HydroCAD output in Appendix D.

Table 1 -Pre-developed Subarea Characteristics

Subarea Identifier	Tributary Area (acres)	Land Usage	Runoff Curve Number	% Impervious (%)	Time of Concentration (min)	1-year Runoff Volume (ac-ft)
Pre-Developed 01	84.259	Agricultural and Wooded Land	78	0%	39.6	4.217
Pre-Developed 02	5.742	Agricultural Land	78	0%	29.3	0.287
Total	**90.001**	**-**	**78**	**0%**	**-**	**4.504**

Table 2 -Pre-developed Peak Flow Rates

Storm Event (year)	Pre-developed 01 Peak Flow Rates (cfs)	Pre-developed 02 Peak Flow Rates (cfs)
1	31.92	2.71
2	49.15	4.14
5	76.33	6.40
10	100.22	8.38
25	135.37	11.29
50	165.50	13.79
100	197.87	16.47

4.0 POST-DEVELOPED ANALYSIS

Exhibit 2, provided within Appendix E, shows the post-developed condition. The Avondale Woods Sections 2 & 3 project will utilize a dry basin for quantity control and a wet basin for water quality and quantity control for the proposed development. Subarea 01, which consists of multi-family residential, and Offsite 01, which consists of a section of Avery Road and open space on the east of the site, will drain to Dry Basin 02. Dry Basin 02 will be used for quantity control only before discharging to Wet Basin 01. Dry Basin 02 was designed under the stormwater management plan for Avondale Woods Phase 1 and 2 project dated October, 2010. The remaining onsite and offsite areas will drain to Wet Basin 01 directly. Subarea 02 and Subarea 03 consist of multi-family residential, while Subarea 04 consists of single-family residential. Offsite 02 consists of grassy open space southwest of the existing railroad tracks that drain to and existing 12" storm sewer onto the site. Offsite 03 and Offsite 04 both consist of a mixture of agricultural land and wooded area. Offsite 04 is being considered a diversion since it naturally drains to the Hirth/Wolpert Creek Watershed, but will be pulled into the Brown/Horch Creek Watershed with the development. The post-developed subarea characteristics are summarized in Table 3. All time of concentration calculations can be found in the HydroCAD output in Appendix D.

Table 3 -Post-developed Subarea Characteristics

Subarea Identifier	Tributary Area (acres)	Tributary to:	Land Usage	Runoff Curve Number	% Impervious (%)	Time of Concentration (min)	1-year Runoff Volume (ac-ft)
Subarea 01	10.927	Dry Basin 02	Multi-family residential	90	65%	10.7	1.153
Subarea 02	7.326	Wet Basin 01	Multi-family residential	90	65%	12.9	0.773
Subarea 03	28.795	Wet Basin 01	Multi-family residential	90	65%	16.1	3.039
Subarea 04	42.953	Wet Basin 01	Single-family residential	83	38%	15.8	2.989
Onsite Total	**90.001**	**-**	**-**	**87**	**52%**	**-**	**7.954**
Offsite 01	3.105	Dry Basin 02	Open Space and Impervious Area	79	19%	30.1	N/A
Offsite 02	4.238	Wet Basin 01	Open Space	74	0%	23.4	N/A
Offsite 03	7.199	Wet Basin 01	Agricultural and Wooded Land	72	0%	37.5	N/A
Offsite 04 (Diversion)	21.494	Wet Basin 01	Agricultural and Wooded Land	71	0%	62.4	0.627
Offsite Total	**36.036**	**-**	**-**	**72**	**2%**	**-**	**0.627**
Total	**126.037**	**-**	**-**		**38%**	**-**	**8.581**

The 1-year runoff volume for the post-developed site increases to 7.954 ac-ft and the diversion from Offsite 04 (which has a 1-year runoff volume of 0.627 ac-ft), which create an increase of 103.49% from the existing condition, which results in 25-year critical storm event.

$$\% \text{ Increase} = [(8.581 - 4.217)/4.217] \times 100 = 103.49\%$$
25-Yr Critical Storm

The approximate divisions of the proposed development between the three subareas of the Dublin Master Plan (120, 150, 920) as well as the allowable release rates per acre are shown in Table 4. The Dublin Master Plan areas that fall under the Hirth/Wolpert Creek watershed (920) will not be counted toward the allowable release rates for the site. Table 5 summarizes the total allowable release rates according to the Dublin Master Plan.

Table 4 -Allowable Release Rates per Acre (Dublin Master Plan)

Onsite Subareas

Allowable Release Rates per Acre							Brown/Horch and Hirth/Wolpert Creek

100	40.30	40.30	5.29	45.59

A separate stormwater master plan was submitted in January 2004 to delineate proposed development projects being planned within the area bounded by Cosgray Road on the west, Hayden Run Road on the south, Avery Road on the east, and Rings Road on the north, and to present a master plan for drainage and stormwater detention for the proposed developments. This master plan, titled "Hydrologic Report For Sewer Line Extension and Preliminary Master Plan For Stormwater Detention – Avery/Hayden Run/Cosgray Road Development," redefined the limits of the Brown/Horch Creek Watershed to extend beyond the existing railroad and created an allowable release rate for the developments both in the City of Columbus (west of existing railroad) and the City of Dublin. The majority of the developments in the area were proposed to discharge to a proposed extended storm sewer system which discharges to an existing detention system at Wilcox Road for The Commons at Tuttle Crossing and The Pines at Tuttle Crossing which eventually discharge at Hayden Run near I-270. The cfs/acre allowable release rates for the developments in the study drainage area are based on the available capacity of the extended storm sewer as well as taking into account the cfs/acre rates established by the City of Dublin Stormwater Master Plan and any diversions to the Brown/Horch Creek Watershed. Exhibit 3 shows the tributary map for the stormwater master plan (January 2004) which identifies the proposed subareas labeled as letters.

The proposed development and offsite areas lie within Subareas K, L, M, N, and O as shown in Drainage Study Exhibit 1 in Appendix E. The cfs/acre allowable release rates to the extended storm sewer (48" storm sewer) at Subarea N (the most downstream subarea) are shown below.

Subarea N – 159.16 acres
cfs/acre for critical storm – 0.05 cfs/acre
cfs/acre for 100-yr event – 0.23 cfs/acre

Subarea L – 67.61 acres
cfs/acre for 100-yr event – 0.65 cfs/acre

Subareas M and K are diversions to the extended storm sewer and are considered in (and will count towards) the cfs/acre release rates for Subarea N as these areas were intended to divert to the extended storm sewer after development as outlined in the stormwater master plan. Subarea O is a diversion and does not count towards the allowable release rates. The acreages of the proposed development and offsite areas within each of the subareas are shown below and the

allowable release rates to the 48" storm sewer in Subarea N are shown in Table 6, and displayed on Exhibit 3 in Appendix E.

Subarea K – 0.00 acres
Subarea L – 4.24 acres
Subarea M – 23.14 acres
Subarea N – 72.91 acres
Subarea O – 25.75 acres

Onsite Area in Subareas K, M, N = 84.60 acres (counts toward allowable release for Subarea N)
Onsite Area in Subarea O = 5.40 acres (does not count toward allowable release rates)

Offsite Area in Subarea L = 4.24 acres (counts toward allowable release for Subarea L)
Offsite Area in Subareas K, M, N = 11.45 acres (counts toward allowable release for Subarea N)
Offsite Area in Subarea O = 20.35 acres (does not count toward allowable release rates)

Table 6 -Allowable Release Rates per the "Hydrologic Report For Sewer Line Extension and Preliminary Master Plan For Stormwater Detention – Avery/Hayden Run/Cosgray Road Development" Master Plan

Storm Event (yr.)	Allowable Release from Subarea L (4.24 acres of Offsite at 0.65 cfs/acre – 100-yr) **[1]**	Allowable Release from Subarea N (11.45 acres of Offsite at 0.23 cfs/acre – 100 yr) **[2]**	Allowable Release from Subarea N (84.60 acres: 0.05 cfs/acre – critical storm, 0.23 cfs/acre – 100 yr)* **[3]**	Total Allowable Release Rates to 48" storm sewer **[1+2+3]**

100	197.87	45.59	24.85

*From Table 5
**From Table 6

Table 7 displays the comparison between the Dublin Master Plan Allowable Release Rates and the "Hydrologic Report For Sewer Line Extension and Preliminary Master Plan For Stormwater Detention – Avery/Hayden Run/Cosgray Road Development" Master Plan release rates. The Avery/Hayden Run/Cosgray Road Development Master Plan allowable release rates are more restrictive than the Dublin Master Plan for the higher events and will therefore be used for the release rates for the site. The post-developed allowable release rates per the more restrictive release rates and the proposed release rates can be found in Table 8, along with the performance summary for Wet Basin 01. Table 9 provides the performance summary for Dry Basin 02. HydroCAD output for the basins can be found in Appendix D.

Table 8 -Allowable vs. Proposed Release Rates & Performance Summary for Wet Basin 01

Storm Event (yr.)	Peak Inflow Rates (cfs)	Allowable Release Rates (cfs)	Wet Basin 01 Proposed Release Rates (cfs)	Maximum W.S.E., T.O.B. = 927.00 (feet)	Storage Volume Utilized (ac-ft)

927.00	0.958	2.614

5.0 OUTLET DESIGN

The outlet structure for Wet Basin 01 will be located on the northeast side of the basin. The outlet structure for Dry Basin 02 is located on the north side of the basin. The location of these structures can be seen on Exhibit 2 in Appendix E.

Wet Basin 01 - Outlet Control Structure (As-built)

- Normal Pool – 919.00 ft.
- Top of Bank – 927.00 ft.
- 100-year elevation – 925.32 ft
- 1st stage outlet – 6-inch orifice, cut into submerged riser pipe, invert at 919.00 ft.
- 2nd stage outlet – Open top of 12" riser pipe, top of crest at 922.50 ft.
- 3rd stage outlet – 8-inch orifice, cut into submerged riser pipe, invert at 923.00 ft
- 4th stage outlet – Open top of 15" riser pipe, top of crest at 924.80 ft.
- 5th stage outlet – Neenah R-4871 grate, top of casting at 926.28 ft.
- Tailwater Control – 24-inch outlet pipe with 0.14% slope, invert at 918.86 ft.

Dry Basin 02 - Outlet Control Structure

- Bottom of Basin – 921.00 ft.
- Top of Bank – 927.00 ft.
- 100-year elevation – 925.89 ft.
- 1st stage outlet – 18-inch outlet pipe with 0.33% slope, invert at 921.40 ft
- Tailwater Control – Wet Basin 01

6.0 WATER QUALITY

The entire development will utilize Wet Basin 01 for water quality. Wet Basin 01 was designed and constructed under the Ohio EPA general permit number OHC000004 which allowed 75% treatment of water quality for wet basins. However, Wet Basin 01 in its as-built condition can be brought up to the Ohio EPA general permit number OHC000005 without retrofitting the outlet structure.

The Ohio EPA requires that the water quality volume for wet basins be detained for a period of 24 hours while not discharging more than the first half of the water quality volume in less than 8 hours. Water quality drawdown for the basin will be provided by the basin's 1st stage outlet listed in Section 5.0. Water quality calculations are summarized in Table 10 for the old Ohio EPA general permit and Table 11 for the current Ohio EPA general permit. Full calculations are provided in Appendix C.

Table 12 -Water Quality Calculations per OHC000004

Basin Identifier	Tributary area (acres)	Percent Impervious (%)	Water Quality Volume* (ac-ft)	Water Quality Elevation (feet)
Wet Basin 01	126.037	38%	1.869	919.50

*75% of water quality for wet basins approved and constructed under Ohio EPA general permit #OH000004

Table 13 -Water Quality Calculations per OHC000005

Basin Identifier	Tributary area (acres)	Percent Impervious (%)	Water Quality Volume (ac-ft)	Water Quality Elevation (feet)
Wet Basin 01	126.037	38%	3.556	919.94

7.0 SEDIMENT BASIN CALCULATIONS

The Ohio EPA requires that during construction a site must provide a means by which to control the sediment laden runoff from the construction site. For each acre of drainage area that is tributary to the sediment basin, a drawdown volume of 67 yd^3 is provided above the normal pool elevation. The basin will additionally provide more than the required 37 yd^3 of settling volume below the normal pool elevation for each acre of disturbed area tributary to the basin.

Wet Basin 01 will be used as a sediment basin during construction. The required drawdown for sediment basins will be provided by skimmer attached to the permanent outlet structure at normal pool. Sediment Basin Calculations are described in Table 12 below and provided within Appendix C.

Table 14 -Sediment Basin Calculations

Basin Identifier	Tributary area (acres)	Disturbed area (acres)	Required Dewatering Volume (ac-ft)	Provided Dewatering Volume (ac-ft)	Provided Dewatering Volume Elevation (ft)	Required Sediment Storage Volume (ac-ft)	Provided Sediment Storage Volume (ac-ft)	Skimmer Orifice Size (inches)
Wet Basin 01	126.037	90.001	5.234	5.283	920.38	2.064	32.954	8.0"

8.0 CONCLUSION

The proposed stormwater management plan for Avondale Woods Sections 2 & 3 meets all requirements for detention and water quality as set forth by the City of Dublin and the Ohio EPA.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Franklin County, Ohio
Survey Area Data: Version 19, Jun 11, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 4, 2014—Aug 27, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
CrA	Crosby silt loam, Southern Ohio Till Plain, 0 to 2 percent slopes	C/D	62.1	30.7%
Ko	Kokomo silty clay loam, 0 to 2 percent slopes	C/D	83.2	41.2%
LeB	Lewisburg-Crosby complex, 2 to 6 percent slopes	D	56.9	28.1%
Totals for Area of Interest			**202.2**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Water Quality required under Ohio EPA Permit No. OHC000004 = 0.75*WQv:					**1.869**	**919.50**

Required Permanent Pool Volume = 130275 cu-ft

Provided Permanent Pool Volume = 1435476 cu-ft

Water Quality Volume calculated using the Ohio EPA formula:

$$WQ_v = \frac{R_v \times P \times A}{12}$$

where:

A = area draining into the BMP (acres)

P = 0.75" precipitation depth (per OHC000004)

Rv = the volumetric runoff coefficient (per OHC000004)

Rv = 0.858i^3 - 0.78i^2 + 0.774i +0.04

Where i = fraction of post-construction impervious surface

SEDIMENT BASIN CALCULATIONS					
BMP	Tributary Area (acres)	Disturbed Area (acres)	Required Dewatering Volume (67 CY/Tributary Acre) (ac-ft)	Dewatering Volume Elevation (feet)	Required Sediment Storage Volume (37 CY/Disturbed Acre) (ac-ft)
Basin 01	126.037	90.001	5.234	920.38	2.064

Routing Diagram for 2020-1174 Avondale Woods Sections 2&3 2022-11-10
Prepared by EMH&T, Printed 11/10/2022

Rainfall Events Listing

Event#	Event Name	Storm Type	Curve	Mode	Duration (hours)	B/B	Depth (inches)	AMC
1	1-yr	Type II 24-hr		Default	24.00	1	2.20	2
2	2-yr	Type II 24-hr		Default	24.00	1	2.63	2
3	5-yr	Type II 24-hr		Default	24.00	1	3.24	2
4	10-yr	Type II 24-hr		Default	24.00	1	3.74	2
5	25-yr	Type II 24-hr		Default	24.00	1	4.44	2
6	50-yr	Type II 24-hr		Default	24.00	1	5.02	2
7	100-yr	Type II 24-hr		Default	24.00	1	5.63	2

Summary for Subcatchment 1S: Subarea 01

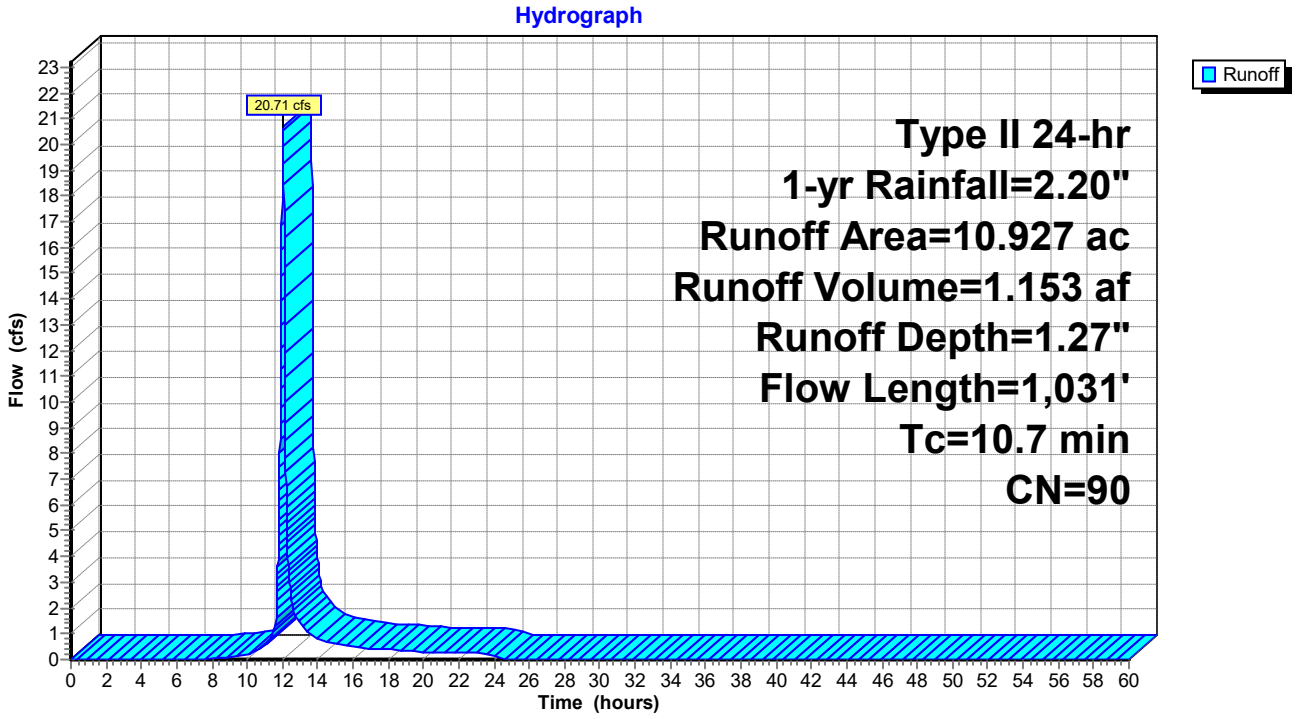
Runoff = 20.71 cfs @ 12.02 hrs, Volume= 1.153 af, Depth= 1.27"
Routed to Pond 11P : Dry Basin 02

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-60.00 hrs, dt= 0.01 hrs
Type II 24-hr 1-yr Rainfall=2.20"

Area (ac)	CN	Description
10.927	90	1/8 acre lots, 65% imp, HSG C
3.824		35.00% Pervious Area
7.103		65.00% Impervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry, To catch basin**
5.7	1,031		3.00		**Direct Entry, Pipe flow**
10.7	1,031	Total			

Subcatchment 1S: Subarea 01



Summary for Subcatchment 2S: Pre-Developed 01 (Brown/Horch)

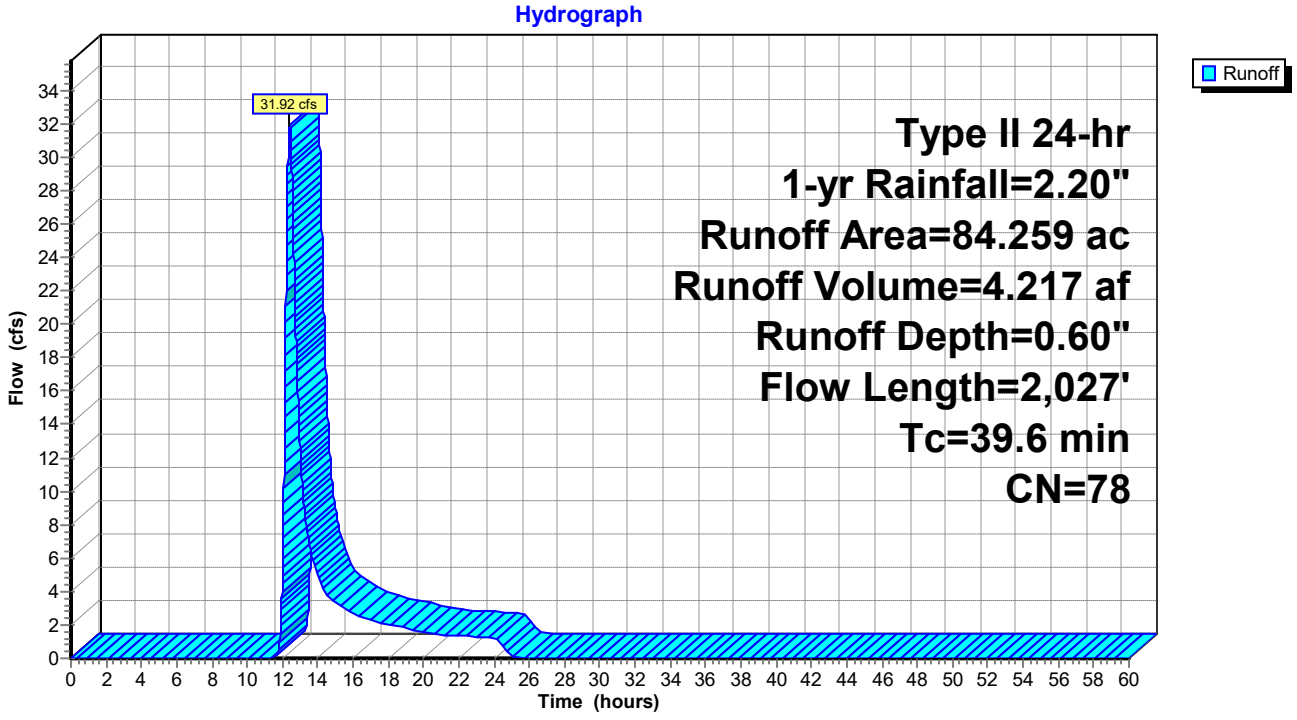
Runoff = 31.92 cfs @ 12.41 hrs, Volume= 4.217 af, Depth= 0.60"

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-60.00 hrs, dt= 0.01 hrs
Type II 24-hr 1-yr Rainfall=2.20"

Area (ac)	CN	Description
1.560	70	Woods, Good, HSG C
82.699	78	Row crops, C&T, Good, HSG C
84.259	78	Weighted Average
84.259		100.00% Pervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
10.8	100	0.0260	0.15		**Sheet Flow, A to B sheet flow** Cultivated: Residue>20% n= 0.170 P2= 2.63"
28.8	1,927	0.0048	1.12		**Shallow Concentrated Flow, B to C shallow flow** Unpaved Kv= 16.1 fps
39.6	2,027	Total			

Subcatchment 2S: Pre-Developed 01 (Brown/Horch)



Summary for Subcatchment 3S: Subarea 02

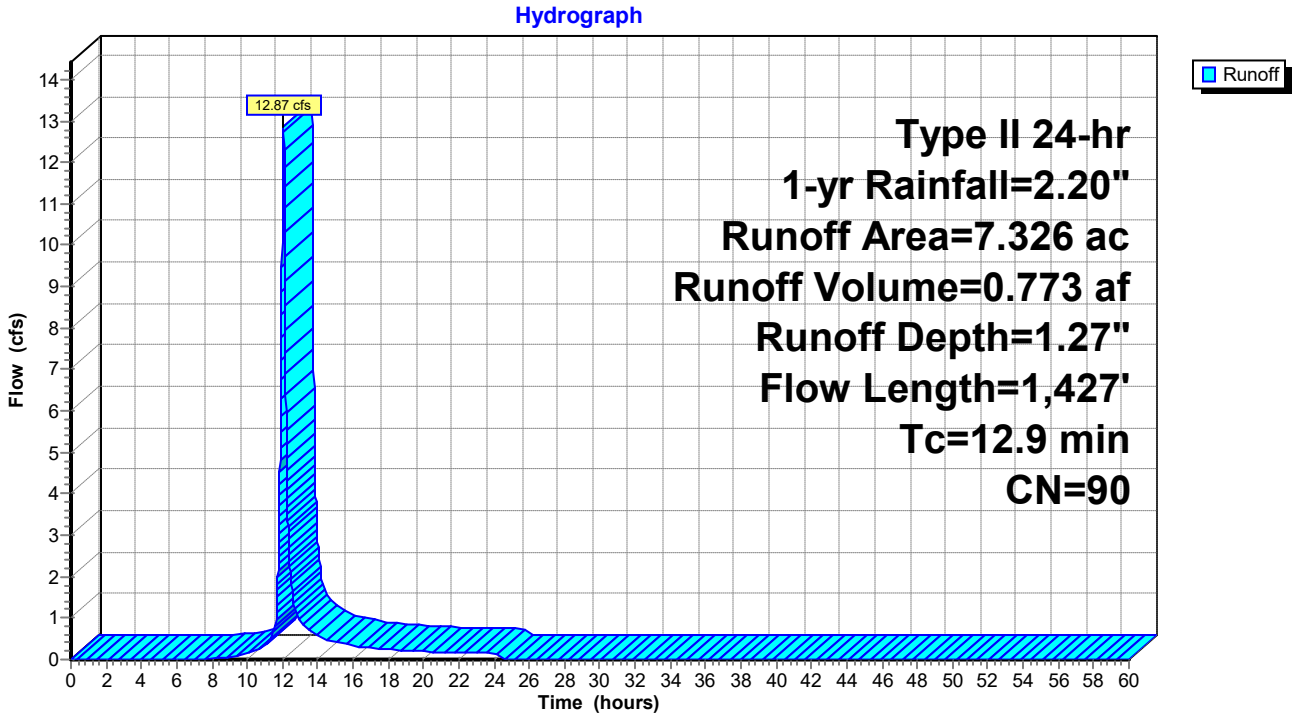
Runoff = 12.87 cfs @ 12.05 hrs, Volume= 0.773 af, Depth= 1.27"
Routed to Pond 12P : Wet Basin 01

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-60.00 hrs, dt= 0.01 hrs
Type II 24-hr 1-yr Rainfall=2.20"

Area (ac)	CN	Description
7.326	90	1/8 acre lots, 65% imp, HSG C
2.564		35.00% Pervious Area
4.762		65.00% Impervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry, To catch basin**
7.9	1,427		3.00		**Direct Entry, Pipe flow**
12.9	1,427	Total			

Subcatchment 3S: Subarea 02



Summary for Subcatchment 4S: Subarea 03

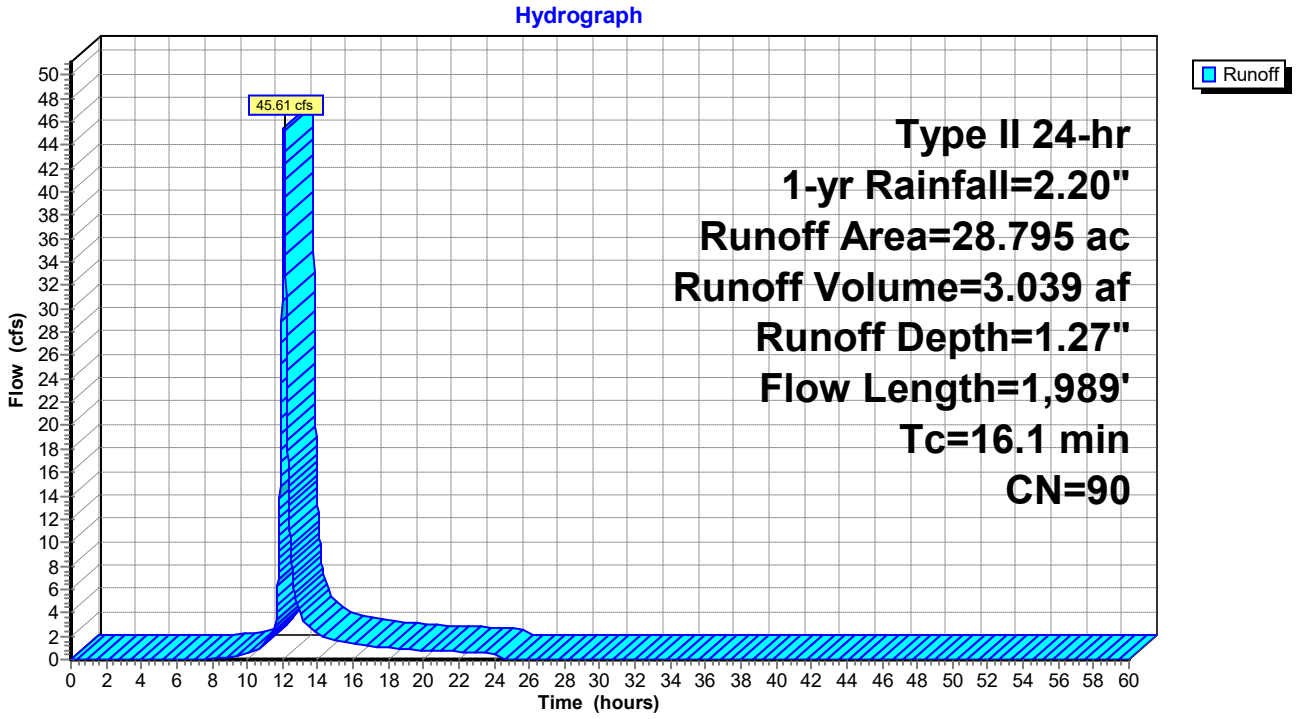
Runoff = 45.61 cfs @ 12.08 hrs, Volume= 3.039 af, Depth= 1.27"
Routed to Pond 12P : Wet Basin 01

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-60.00 hrs, dt= 0.01 hrs
Type II 24-hr 1-yr Rainfall=2.20"

Area (ac)	CN	Description
28.795	90	1/8 acre lots, 65% imp, HSG C
10.078		35.00% Pervious Area
18.717		65.00% Impervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
5.0					**Direct Entry, To catch basin**
11.0	1,989		3.00		**Direct Entry, Pipe flow**
16.1	1,989	Total			

Subcatchment 4S: Subarea 03



Summary for Subcatchment 5S: Subarea 04

Runoff = 44.43 cfs @ 12.09 hrs, Volume= 2.989 af, Depth= 0.84"
Routed to Pond 12P : Wet Basin 01

Runoff by SCS TR-20 method, UH=SCS, Weighted-CN, Time Span= 0.00-60.00 hrs, dt= 0.01 hrs
Type II 24-hr 1-yr Rainfall=2.20"

Area (ac)	CN	Description
42.953	83	1/4 acre lots, 38% imp, HSG C
26.631		62.00% Pervious Area
16.322		38.00% Impervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description

- **Outlet "K":** On Clagg Tract, at railroad, approx. 2500' northwest of Avery Road crossing.

The natural drainage area to this outlet consists of 3.93 acres on the Rings Family Farm parcel, 0.21 acre on the Lifestyles parcel, and 6.40 acres on the Clagg Tract, all in the City of Columbus. Drainage from this area ultimately discharges into Hayden Run, just west of I-270. Under post-development conditions, it is assumed that all of the runoff associated with drainage areas to Outlet "K" will be captured and diverted to detention facilities on those above-mentioned sites. (In the case of the Clagg parcel, the post-development runoff is assumed to be diverted to a different outlet on the same project site). Since all drainage area associated with Outlet "K" is diverted, there is no allowable discharge associated with this area. See post-development Outlets "F", "I" and "L" for a description of the diverted areas.

- **Outlet "L":** On Rings Family Farm, at railroad, approximately 3400' northwest of Avery Road crossing.

The natural drainage to this outlet consists of 74.75 acres on the Rings Family Farm (Columbus), 33.51 acres on Pembrooke Crossing (Columbus), 43.91 acres on the Miller Tract (Dublin), and 28.55 acres from parcels of individual land owners north of the Miller Tract (Dublin). Drainage from this area ultimately discharges to an existing 60-inch storm sewer line adjacent to The Vinings, a residential development east of Avery Road, and then into Hayden Run, just west of I-270. It is proposed to extend this 60-inch storm sewer line westward to the development area on the west side of the railroad, to provide an improved outlet for the area. For the post-development condition, it is anticipated that each of the above-mentioned project tracts will provide their own detention facilities. (See Outlet "R" for information pertinent to Pembrooke Crossing; Outlet "S" for information pertinent to the Miller Tract, and Outlet "T" for information pertinent to the parcels north of the Miller Tract). It is not known at this point whether the detention facilities for Outlets "L", "R", "S", and "T" will be connected in series, but their discharges will certainly be combined before passing under the railroad. Allowable discharges for these outlets are based on a combination of community requirements and storm sewer design parameters for the proposed sewer line extension. See the report text for a detailed accounting of allowable discharges for these outlets.

For calculation of the detention storage volume requirement on the Rings Family Farm parcel itself, the post-development drainage area is expected to lose approximately 4.03 acres to Outlet "C", and 11.90 acres to Outlet "D" of the previously mentioned 74.75 acres that is naturally tributary to Outlet "L". However, it will gain approximately 4.86 acres of site area that is naturally tributary to Outlet "W", and 3.93 acres that is naturally tributary to Outlet "K".

Post-development parameters at Outlet "L" for Rings Family Farm parcel:

Drainage area for post-development condition = 74.75 – 4.03 – 11.90 + 4.86 + 3.93 = 67.61 ac. = 0.1056 sq. mi.
Curve number for post-development condition: From previous calculation for Outlets C, D, and E, assume CN = 88.
Time of Concentration: Assume 10 minutes to first storm sewer inlet, plus travel time in approximately 2400 feet of storm sewer at an average velocity of 3 ft/sec.
Travel time in sewer = 2400 / 3 = 800 sec. = 0.22 hr.
Total Tc = 0.17 + 0.22 = 0.39 hr.

Allowable release rate: 44.0 cfs for 100-year storm.

- **Outlet "M":** On Homewood Tract, at Avery Road, approx. 3500' north of Hayden Run Road..

The natural drainage area to this outlet consists of 23.20 acres on the Homewood parcel, and an unspecified amount of drainage area to the south of the Homewood parcel. The overall watershed also includes natural tributary area associated with Outlet "K". Drainage from this area ultimately discharges into Hayden Run, just west of I-270. Under post-development conditions, the 23.20 acres on the Homewood parcel will be diverted to Outlet "N". Since all drainage area associated with Outlet "M" is diverted, there is no allowable discharge associated with this area. See post-development Outlet "N" for a description of the diverted area.

CRAMER CREEK WATERSHED PER CITY OF DUBLIN STORMWATER MASTER PLAN

HIRTH/WOOLPERT WATERSHED PER CITY OF DUBLIN STORMWATER MASTER PLAN

BROWN/HORCH WATERSHED PER CITY OF DUBLIN STORMWATER MASTER PLAN

TRIBUTARY AREA FOR 60" STORM SEWER INSTALLED WITH "THE VININGS"

- **Outlet "N":** On Homewood/Patch Tract, at eastern property line near Avery Road.

The natural drainage to this outlet consists of 71.14 acres from the Homewood Tract (Dublin), and 3.10 acres from the Patch Tract (Columbus) on the eastern side of the railroad. In addition, this outlet contains flow associated with drainage area from Outlet "L" on the western side of the railroad. Drainage from this area ultimately discharges to an existing 60-inch storm sewer line adjacent to The Vinings, a residential development east of Avery Road, and then into Hayden Run, just west of I-270. It is proposed to extend this 60-inch storm sewer line westward to the development area on the west side of the railroad, to provide an improved outlet for the area. For the post-development condition, the drainage area to Outlet "N" will include the afore-mentioned 71.14 and 3.10 acres, plus the following onsite areas that are naturally tributary to other outlet points, as follows: 23.20 acres naturally tributary to Outlet "M"; 37.19 acres naturally tributary to Outlet "O"; 10.85 acres naturally tributary to Outlet "P", and 13.68 acres naturally tributary to Outlet "Q". Allowable discharges for this outlet are based on a combination of community requirements and storm sewer design parameters for the proposed sewer line extension. See the report text for a detailed accounting of allowable discharges for this outlet.

Post-development parameters at Outlet "N" for Homewood/Patch parcel:

Drainage area for post-development condition = 71.14 + 3.10 + 23.20 + 37.19 + 10.85 + 13.68 = 159.16 ac. = 0.2487 sq. mi.
Curve number for post-development condition: It is assumed that this area will develop as mainly single-family residential. Assume CN = 81.
Time of Concentration: Assume 10 minutes to first storm sewer inlet, plus travel time in approximately 3500 feet of storm sewer at an average velocity of 3 ft/sec.
Travel time in sewer = 3500 / 3 = 1167 sec. = 0.28 hr.
Total Tc = 0.17 + 0.32 = 0.49 hr.

Allowable release rate: 7.4 cfs for critical storm; 37.1 cfs for 100-year storm.
