PROJECT SUMMARY

Project:	Dublin Scioto Hitting Facility
Location:	City of Dublin, Franklin County, Ohio
Type:	Stormwater Management Plan
Reviewing Agency:	City of Dublin, Ohio EPA

HYDROLOGIC SUMMARY

Rainfall Data: NOAA Atlas 14, Volume 2, Version 3, 2004

1-yr	2.20”
2-yr	2.63”
5-yr	3.24”
10-yr	3.74”
25-yr	4.44”
50-yr	5.02”
100-yr	5.63”

Rainfall Distribution:	NRCS Type II 24 hour
Detention Policy:	City of Dublin
Water Quality:	City of Dublin, Ohio EPA
Hydrology Modeling Program:	HydroCAD 10.20

DESIGN SUMMARY

Detention:	StormTech MC-3500 Chambers & Pipe Storage
Water Quality:	StormTech MC-3500 Chambers
Receiving Water Body:	City of Dublin MS4 which discharges to the Scioto River

REVISIONS

TABLE OF CONTENTS

TABLES

APPENDICES

1.0 INTRODUCTION

The following report provides a detailed analysis and design of the Stormwater Management Plan for Dublin Scioto Hitting Facility. The proposed site is located north of Hard Road just northeast of the existing school building. The proposed project area involves the development of an open space area into a hitting facility. The Stormwater Management Plan was prepared in accordance with the requirements of both the City of Dublin and the Ohio EPA. The runoff from this site will be routed through a StormTech underground chamber and pipe storage for water quality and quantity control before discharging to the Scioto River to the southwest.

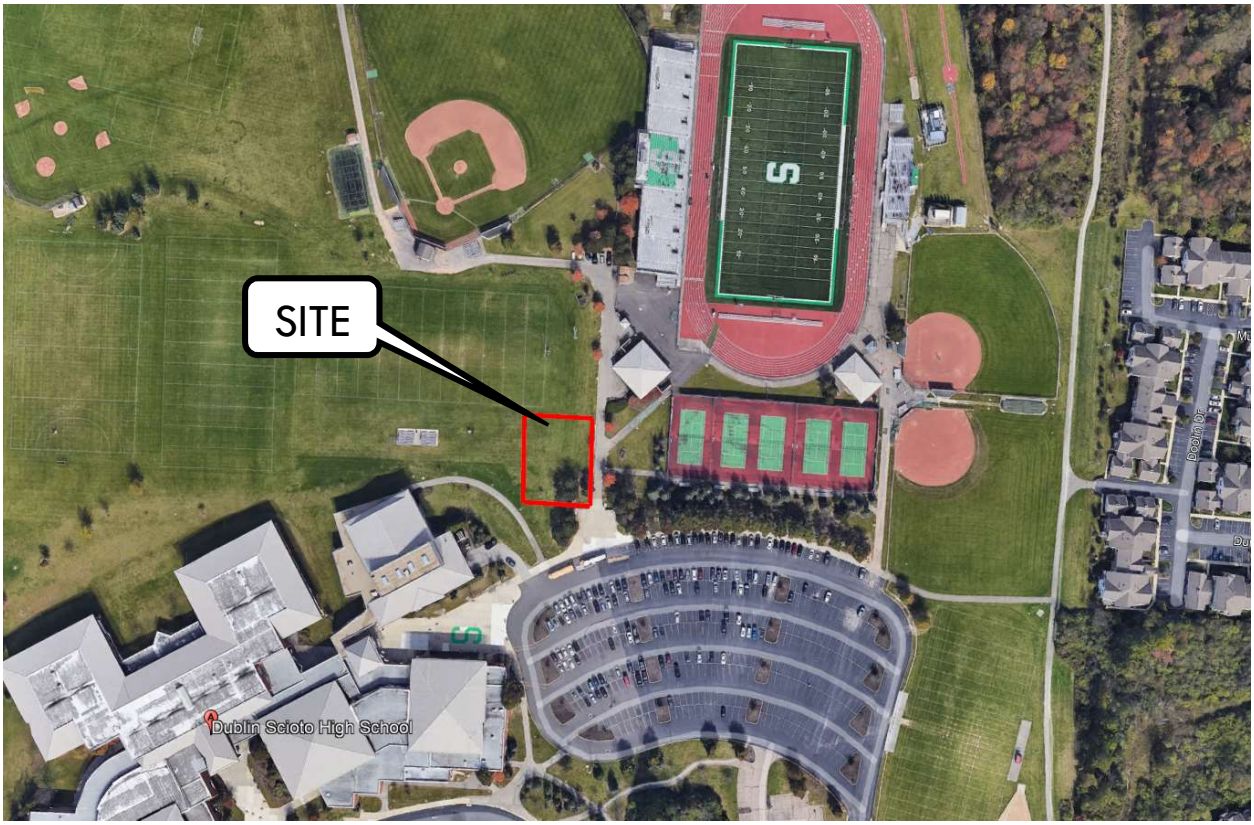

Figure 1 – Site Location Map

2.0 HYDROLOGIC ANALYSIS

Hydrologic parameters such as Runoff Curve Number (RCN) and Time of Concentration were determined using standard Natural Resources Conservation Service (NRCS) methodology. The 1-, 2-, 5-, 10-, 25-, 50-, and 100-year storm event discharge amounts were calculated using the NRCS TR-55 method. This analysis reflects the NRCS Type II distribution, 24-hr storm duration. Rainfall depths were obtained from NOAA Atlas 14, Volume 2, Version 3, 2004. The peak flow rates were computed using the HydroCAD 10.20 computer program.

3.0 PRE-DEVELOPED ANALYSIS

The pre-developed condition, as seen on Exhibit 1 in Appendix E, consists of open space located in Dublin Master Planned Sub-Basins. Pre-developed 01 and Offsite naturally drain to the southwest to the Scioto River. The project area is located within hydrologic soil group D (Blount silt loam).

Pre-developed subarea characteristics are summarized in Table 1. The City of Dublin Master Planned Allowable Release Rates are provided in Table 2. Time of concentration calculations can be found in the HydroCAD 10.20 output in Appendix D.

Table 1 -Pre-developed Subarea Characteristics

Subarea Identifier	Tributary Area (acres)	Land Usage	Runoff Curve Number	% Impervious (%)	Time of Concentration (min)	1-year Runoff Volume (ac-ft)
Pre-developed 01	0.83	Open Space, Impervious Area	82	10%	11.0	0.054
Offsite 01	0.23	Open Space, Impervious Area	81	4%	18.9	-
Total	**1.06**	**-**	**82**	**8%**	**-**	**0.054**

Table 2 -City of Dublin Master Planned Allowable Release Rates

Allowable Release Rates per Acre *Hard Road*

Sub-Basin	1-year	2-year	5-year	10-year	25-year	50-year	100-year
950	0.4	0.5	0.7	0.8	1.1	1.6	2.1
970	0.3	0.4	0.5	0.6	0.8	1.2	1.6

Post-Developed Area per Sub-Basin

Sub-Basin	Area (Acres)
950	0.73
970	0.10
Total	0.83

Allowable Release Rates per Acre *Cramer Creek*

Sub-Basin	1-year	2-year	5-year	10-year	25-year	50-year	100-year
950	0.29	0.37	0.51	0.58	0.80	1.17	1.53
970	0.03	0.04	0.05	0.06	0.08	0.12	0.16
Total	**0.32**	**0.41**	**0.56**	**0.64**	**0.88**	**1.29**	**1.69**

Note: Allowable Release Rates per Acre were taken from the City of Dublin Master Plan. These values were then multiplied by the total acreage in that Sub-Basin to generate the Allowable Release Rates.

4.0 POST-DEVELOPED ANALYSIS

Exhibit 2, provided within Appendix E, shows the post-developed Phase 1 condition. The Dublin Scioto Hitting Facility project will utilize pipe storage to provide water quantity control for the proposed development. Subarea 01 and Offsite 01 will drain to the south to Detention 01, which will discharge to the storm sewer along John Shields Parkway. Detention 01 consists of seven ADS MC-3500 StormTech chambers which will provide water quality treatment in combination with 450-feet of 42-inch storm sewer for additional detention volume. Undetained 01 will drain directly to the existing storm sewer system. The post-developed subarea characteristics are summarized in Table 3. The post-developed allowable release rates and proposed release rates can be found in Table 4.

Table 3 -Post-developed Subarea Characteristics

Subarea Identifier	Tributary Area (acres)	Land Usage	Runoff Curve Number	% Impervious (%)	Time of Concentration (min)	1-year Runoff Volume (ac-ft)
Subarea 01	0.73	Open Space, Impervious cover	87	38%	10.0	0.065
Undetained 01	0.10	Open Space, Impervious Area	98	100%	5.0	0.016
Offsite 01	0.23	Open Space, Impervious Area	81	4%	18.9	-
Total	**1.06**	**-**	**87**	**37%**	**-**	**0.081**

The 1-year runoff volume for the post-developed site increases to 0.081 ac-ft, an increase of 50.00% from the existing condition, which results in 10-year critical storm event.

$$\% \text{ Increase} = [(0.081 - 0.054)/0.054] \times 100 = 50.00\%$$
10-Yr Critical Storm

Table 4 -Allowable Release Rates

Storm Event (yr.)	Pre-developed 01 Peak Flow Rates (cfs)	Onsite Allowable Release Rates [1] (cfs)	Offsite 01 Peak Flow Rates [2] (cfs)	Allowable Release Rates [1] + [2] (feet)
1	0.32	0.32	0.19	**0.51**
2	0.41	0.32	0.27	**0.59**
5	0.56	0.32	0.39	**0.71**
10	0.64	0.32	0.50	**0.82**
25	0.88	0.88	0.66	**1.54**
50	1.29	1.29	0.79	**2.08**
100	1.69	1.69	0.93	**2.62**

Table 5 -Allowable vs. Proposed Release Rates

Storm Event (yr.)	Allowable Release Rates (cfs)	Proposed Release Rates (cfs)	Maximum W.S.E., Lowest Top of Pipe = 904.00 (feet)	Storage Volume Utilized (cu-ft)
1	**0.51**	**0.33**	900.84	2,863
2	**0.59**	**0.39**	901.42	3,994
5	**0.71**	**0.48**	901.73	4,534
10	**0.82**	**0.56**	901.78	4,618
25	**1.54**	**1.45**	901.92	4,853
50	**2.08**	**2.12**	902.20	5,226
100	**2.62**	**2.45**	903.82	5,902

Storage Utilized (100-yr event): 5,902 cu-ft
Storage Provided (Top of System = 904.00 ft.): 5,928 cu-ft

5.0 OUTLET DESIGN

The outlet structure for the pipe storage described below. The location of this structure can be seen on Exhibit 2 in Appendix E.

Detention 01 - Outlet Control Structure

- 500-feet of 42-inch pipe, invert 898.50 ft.
- 7 ADS StormTech MC-3500 chambers
    - Bottom of Stone, invert 898.50 ft.
    - Bottom of Chamber, invert 899.25 ft.
    - Top of Chamber, invert 903.00 ft.
    - Top of Stone, invert 904.00 ft.
    - Minimum Cover Elevation 904.50 ft.
    - Maximum Cover Elevation 911.00 ft.
- 1st stage outlet – 0.50-inch orifice, cut into weir wall, invert at 897.50 ft.
- 2nd stage outlet – 4-foot long weir wall, crest of weir at 901.70 ft.
- Tailwater Control – 6-inch orifice plate on a 12-inch outlet pipe with 0.50% slope, invert at 897.50 ft. (controls 1st through 2nd stage outlets)

6.0 WATER QUALITY

The seven StormTech Chambers that make up part of Detention 01 treat Subarea 01 and Offsite, providing a water quality treatment volume of 0.023 ac-ft meeting the water quality treatment requirement per the City of Dublin SWDM and the Ohio EPA. The water quality volume is treated entirely by the StormTech system.

The Ohio EPA requires that the water quality volume for underground detention systems be detained for a period of 24 hours while not discharging more than the first half of the water quality volume in less than 8 hours.

The StormTech Isolator Row has been approved for a water quality treatment rate of 1 gallon per minute (0.0022 cfs) per square foot per the Ohio EPA. The Rainwater and Land Development Manual Provisional Practices Section outlines the approved flow rate stated above and has been provided in Appendix C for reference. The proposed MC-3500 chambers have a bottom surface area of 43.2 SF per chamber. The proposed site produces a water quality flow of 0.40 cfs. Therefore StormTech system will require 5 chambers of StormTech Isolator Row in order to provide adequate water quality treatment (0.40 CFS/(0.0022 cfs/SF *43.2 SF = 5 chambers). The proposed system will provide 7 Isolator row chambers meeting and exceeding this requirement.

Water quality drawdown for the StormTech system will be provided by Detention 01's 0.50-inch orifice as described in Section 5.0. See Appendix C for the water quality calculations.

Table 1 -Water Quality Calculations

Basin Identifier	Tributary area to StormTech 01 (acres)	Percent Impervious (%)	Required Water Quality Volume (ac-ft)	Provided Water Quality Volume (ac-ft)	Water Quality Elevation (feet)
StormTech 01	0.96	30%	0.023	0.023	899.84

7.0 CONCLUSION

The proposed stormwater management plan for Dublin Scioto Hitting Facility meets all requirements for detention and water quality as set forth by the City of Dublin and the Ohio EPA.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Franklin County, Ohio
Survey Area Data: Version 21, Sep 8, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 4, 2014—Aug 27, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Totals for Area of Interest			**1.1**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

MANGOS PLACE - DUBLIN

STORMTECH ISOLATOR ROW CALCULATION

Subarea 01 Isolator Row

Percent Impervious =	30%	
C =	0.23	$C = 0.858i^3 - 0.78i^2 + 0.774i + 0.04$
		Where i = fraction of post-construction impervious surface
intensity =	1.85	in/hr (Reference Appendix C from OEPA General Permit)
Water Quality Flow =	0.40	cfs
Chamber Model =	MC-3500	
Flow Per Chamber =	0.10	cfs
Required Chambers =	5	
Provided Chambers =	5	

WATER QUALITY VOLUME CALCULATIONS

BMP	Subarea Identifier	Area (acres)	Percent Impervious (%)	Rv	Water Quality Volume (ac-ft)	Water Quality Volume Elevation (feet)
StormTech 01	Subarea 01	0.96	30%	0.32	0.023	-
	Total	**0.96**	**30%**	**0.32**	**0.023**	899.84

Water Quality Volume calculated using the Ohio EPA formula:

$$WQ_v = \frac{R_v \times P \times A}{12}$$

where:
A = area draining into the BMP (acres)
P = 0.90" precipitation depth
Rv = the volumetric runoff coefficient
Rv = 0.05+0.9i
Where i = fraction of post-construction impervious surface

TABLE OF CONTENTS

All pipe joints and other connections must be watertight connections.

Design Considerations – Flow Through Treatment Devices

Underground practices should be designed for the appropriate traffic loading and dead loading at the surface.

Consider clearance and accessibility for maintenance.

Underground practices may not be suitable for locations where spill control is necessary.

Maintenance – Flow-Through Treatment Devices

All flow-through treatment devices must be inspected and maintained in accordance with the manufacturer's instructions and/or recommendations.

SUBSURFACE GEOTEXTILE FILTER SYSTEM

Description

A subsurface geotextile filter is a pretreatment practice that combines open-bottom underground storage vaults or chambers with a durable synthetic fabric which serves as a media to filter gross and suspended solids. The geotextile filter bed or area is sized to pass the Water Quality Flow. Solids accumulate on the geotextile surface and must be periodically removed to maintain system performance. These systems are utilized as pretreatment for underground stormwater management systems.

Design Criteria – Subsurface Geotextile Filter System

Geotextile Filter - The filter media shall include a minimum of two layers of woven geotextile (Maine DEP, 2016) meeting AASHTO M288 for Stabilization, Class I, <50% elongation. Geotextile should be placed over an aggregate base without damaging the geotextile. All geotextile ends, seams and splices shall be bound to prevent tearing or short-circuiting.

Geotextile Specifications (AASHTO M288 for Stabilization, Class I, Woven, <50% elongation)			
Test	Test Method	Units	Rating
Grab Strength	ASTM D 4632	lbf.	315
Tear Strength	ASTM D 4533	lbf.	113
Puncture Strength	ASTM D 6241	lbf.	620
Permittivity	ASTM D 4491	sec-1	0.05
Apparent Opening Size (AOS)	ASTM D 4751	mm (US Sieve)	0.43 (40 sieve)

Filter Area – The geotextile filter shall be sized to pass the WQf calculated for the practice's drainage area without bypassing. A maximum design hydraulic loading rate of 1.0 gpm per sq. ft. of filter area

(0.0022 cfs per sq. ft.) shall be used to size the geotextile filter area. The filter area is area of exposed geotextile at the open bottom of the storage vault or chamber.

Filter Outlet - The WQf through the geotextile filter must discharge into the extended detention storage (i.e. prior to the drawdown control device). The hydraulic capacity of any underdrains or manifolds connecting the pretreatment to the USWMS must exceed the capacity of the geotextile filter.

Access – Both the geotextile filter and WQf diversion or routing devices must be readily accessible from the surface for inspection and maintenance. Access points of sufficient size (generally ≥24 inches in diameter) should be located as necessary to remove the accumulated sediment from the entire filter area. An access point at each end of the filter is recommended. If multiple filter areas are used, each separate filter area shall have an access point for maintenance. Observation wells under 18 inches in diameter may be installed as necessary but should not be considered sufficient for maintenance access.

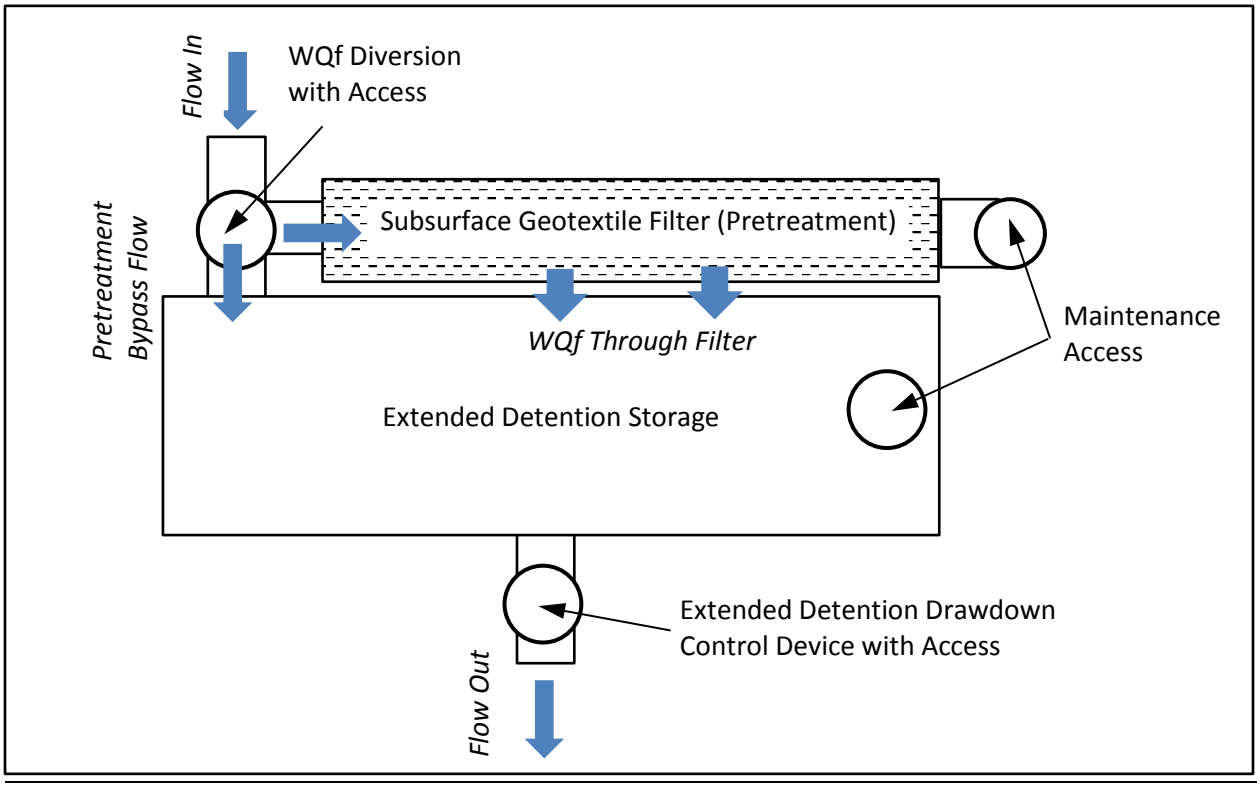

Figure 1: Schematic plan view of a subsurface media filter pretreatment system with a USWMS providing extended detention (after Maine DEP, 2016)

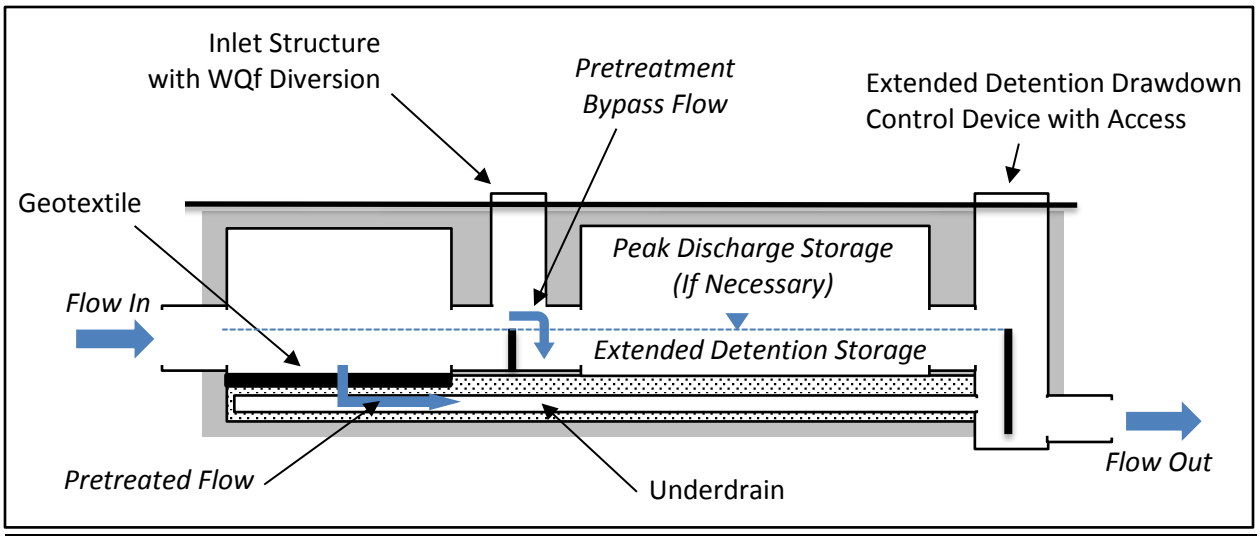

Figure 2: Schematic section of a subsurface media filter pretreatment system for a USWMS providing extended detention

Design Considerations - Subsurface Geotextile Filter System

The design engineer is responsible for the structural integrity of an underground stormwater system and any infrastructure it supports.

Consider the surface clearance and accessibility requirements for maintenance equipment.

Subsurface Geotextile Filter System may have confined entry limitations per Occupational Safety and Health Administration (OSHA) regulations.

The design should prevent reverse flow through the geotextile filter from groundwater or detained stormwater.

Maintenance – Subsurface Geotextile Filter System

An Operation and Maintenance Manual shall be provided for the geotextile filter system that specifies the maintenance procedures and schedule. Annual cleaning and removal of accumulated sediment is recommended and shall occur at least once every five years.

Construction – Subsurface Geotextile Filter System

A Subsurface Geotextile Filter Systems USWMS should not be placed into service until major construction activities have ceased and the drainage area has been permanently stabilized.

Event	Rainfall (inches)	Runoff (cfs)	Volume (acre-feet)	Depth (inches)
1 year	2.20	0.95	0.054	0.78
2 year	2.63	1.35	0.076	1.09
5 year	3.24	1.94	0.109	1.57
10 year	3.74	2.44	0.137	1.98
25 year	4.44	3.17	0.179	2.58
50 year	5.02	3.78	0.214	3.10
100 year	**5.63**	**4.43**	**0.252**	**3.65**

Events for Subcatchment 2S: Subarea 01

Event	Rainfall (inches)	Runoff (cfs)	Volume (acre-feet)	Depth (inches)
1 year	2.20	1.20	0.065	1.06
2 year	2.63	1.60	0.086	1.42
5 year	3.24	2.18	0.119	1.95
10 year	3.74	2.66	0.146	2.40
25 year	4.44	3.34	0.185	3.04
50 year	5.02	3.90	0.218	3.59
100 year	**5.63**	**4.49**	**0.253**	**4.16**

Events for Subcatchment 3S: Offsite 01

Event	Rainfall (inches)	Runoff (cfs)	Volume (acre-feet)	Depth (inches)
1 year	2.20	0.19	0.014	0.73
2 year	2.63	0.27	0.020	1.04
5 year	3.24	0.39	0.029	1.50
10 year	3.74	0.50	0.037	1.90
25 year	4.44	0.66	0.048	2.50
50 year	5.02	0.79	0.058	3.00
100 year	**5.63**	**0.93**	**0.068**	**3.55**

Events for Subcatchment 5S: Undetained 01

Event	Rainfall (inches)	Runoff (cfs)	Volume (acre-feet)	Depth (inches)
1 year	2.20	0.32	0.016	1.97
2 year	2.63	0.38	0.020	2.40
5 year	3.24	0.47	0.025	3.01
10 year	3.74	0.55	0.029	3.51
25 year	4.44	0.65	0.035	4.20
50 year	5.02	0.74	0.040	4.78
100 year	**5.63**	**0.83**	**0.045**	**5.39**

Events for Pond 1P: Detention 01

Event	Inflow (cfs)	Primary (cfs)	Elevation (feet)	Storage (cubic-feet)
1 year	1.33	0.01	900.84	2,863
2 year	1.79	0.01	901.42	3,994
5 year	2.47	0.09	901.73	4,534
10 year	3.04	0.30	901.78	4,618
25 year	3.85	1.38	901.92	4,853
50 year	4.52	1.99	902.20	5,226
100 year	**5.22**	**2.33**	**903.82**	**5,902**

Events for Link 4L: Outfall 01

Event	Inflow (cfs)	Primary (cfs)	Elevation (feet)
1 year	0.33	0.33	**0.00**
2 year	0.39	0.39	0.00
5 year	0.48	0.48	0.00
10 year	0.56	0.56	0.00
25 year	1.45	1.45	0.00
50 year	2.12	2.12	0.00
100 year	**2.45**	**2.45**	0.00
